1 Problem 1

Our goal is to find the smallest k so that we can make k' cents postage for any integer $k' \geq k$ with 4-, 9- and 15-cent stamps. (k and k' are restricted to be integers throughout the prompts given below.)

1.1 solution

1. Prove that if you can make k cents postage with some combination of 4-, 9-, and 15-cent stamps that includes at least 2 4-cent stamps, then you can make $k+1$ cents postage

- (a) suppose there $\exists k \in \mathbb{Z}[4a + 9b + 15c = k]$ and that $a \geq 2$
let $a' = a-2$ and $b' = b+1$ and $c' = c$ and $k' = 4a' + 9b' + 15c'$;
also that $a', b', c', k' \in \mathbb{N}$ so

$$\begin{aligned} k' &= 4(a-2) + 9(b+1) + 15c \\ &= 4a - 8 + 9b + 9 + 15c \\ &= k - 8 + 9 = k + 1 \end{aligned}$$

conclusion: you can make $k+1$ cents postage given that you have at least 2 4-cent postages

*made in Overleaf

2. Prove that if you can make k cents postage with some combination of 4-, 9-, and 15-cent stamps that includes at least 2 9-cent stamps, then you can make $k+1$ cents postage

- (a) suppose there $\exists k \in \mathbb{Z}[4a + 9b + 15c = k]$ and that $b \geq 2$
 let $a' = a+1$ and $b' = b-2$ and $c' = c+1$ and $k' = 4a' + 9b' + 15c'$; also that $a', b', c', k' \in \mathbb{N}$ so

$$\begin{aligned} k' &= 4(a+1) + 9(b-2) + 15(c+1) \\ &= 4a + 4 + 9b - 18 + c + 15 \\ &= k - 18 + 19 = k + 1 \end{aligned}$$

conclusion: you can make $k+1$ cents postage given that you have at least 2 9-cent postages

3. Prove that if you can make k cents postage with some combination of 4-, 9-, and 15-cent stamps that includes at least 1 15-cent stamps, then you can make $k+1$ cents postage

- (a) suppose there $\exists k \in \mathbb{Z}[4a + 9b + 15c = k]$ and that $c \geq 1$
 let $a' = a+4$ and $b' = b$ and $c' = c-1$ and $k' = 4a' + 9b' + 15c'$;
 also that $a', b', c', k' \in \mathbb{N}$ so

$$\begin{aligned} k' &= 4(a+4) + 9(b) + 15(c-1) \\ &= 4a + 16 + 9b + c - 15 \\ &= k - 15 + 16 = k + 1 \end{aligned}$$

conclusion: you can make $k+1$ cents postage given that you have at least 1 15-cent postages

4. Prove that if you have k cents postage for some $k \geq 14$ then you must have either 1) at least 2 4-cent stamps; 2) at least 2 9-cent stamps; or 3) at least 1 15-cent stamp.

- (a) \therefore where $\exists a, b, c \in \mathbb{N}[k = 4a + 9b + 15c \geq 14]$
 base case: $a, b, c = 0$; then $k \nmid 14$ so cannot be true

i. lemma: if $c \geq 1 \rightarrow k \geq 14$ in this case, $k \geq 15 \cdot c$

$$= 15 \geq 14$$

ii. cases where 2 of a,b,c are 0 but one is not.

A. $a \neq 0$; note that if $a < 4, k < 14$ by algebra (in this case, $k = 4a$); by contrapositive (modus ponens), $a \geq 4 > 2$ in this case

B. $b \neq 0$; note that if $b < 2, k < 14$ by algebra (in this case, $k = 9b$); by contrapositive (modus ponens), $b \geq 2$ in this case

C. $c \neq 0$; see lemma

iii. cases where 1 of a,b,c are 0 but two are not.

A. $a, b \neq 0; k = 4a + 9b$ if $a \leq 1 \wedge b \leq 1$, then $k < 14$. By contrapositive (modus ponens), one of a,b must be ≥ 2 (individually; in other words, $a \geq 2 \vee b \geq 2$)

B. $b, c \neq 0$; see lemma

C. $c, a \neq 0$; see lemma

iv. case where none are 0

A. see lemma

5. Find the smallest k so that you can make k' cents postage for any $k' \geq k$ with 4-, 9-, and 15-cent stamps.

(a) suppose that $\exists a, b, c \in \mathbb{N}[k = 4a + 9b + 15c]$

this is a case of $p \vee q \vee r$ where

i. $p \equiv a \geq 2$

ii. $q \equiv b \geq 2$

iii. $r \equiv c \geq 1$ (if any of the above conditions are met, $k+1$ can be performed.)

furthermore, $k+1$ must also contain these conditions ($p \vee q \vee r$ must also apply to $k+1$)

method: find smallest of the base cases

(b) strong induction: for all natural numbers $p(i) \leq 15$, if $p(n)$ is true for $n = 18, \dots, k-1$ then $p(k)$ is true

- i. base case: is $p(n)$ true for 15? yes, because $15 = 15 \cdot 1$
- ii. base case: is $p(n)$ true for 16? yes, because $16 = 4 \cdot 4$
- iii. base case: is $p(n)$ true for 17? yes, because $17 = 4 \cdot 2 + 9$
- iv. base case: is $p(n)$ true for 18? yes, because $18 = 9 \cdot 3$

6. For your chosen k , prove that you can make k' cents postage for any $k' \geq k$ with some combination of 4-, 9-, and 15-cent stamps.

(continued from proof above)

(a) strong induction: for all natural numbers $p(i) \leq 15$, if $p(n)$ is true for $n = 15, \dots, k - 1$ then $p(k)$ is true

- i. suppose $p(i)$ is true for all i where $18 \leq i \leq k - 1$ $p(k) = 4a + 9b + 15c$
from 15... 18, you can add 4 to each and generate the next 4 digits... in other words:

$$k + 1 = k - 3 + 4$$

$$= k - 3 + 4 \cdot a$$

where $a =$

2 problem 2

Problem 2 (10 points): Prove by induction that $\sum_{i=1}^n (2i + 3) = n \cdot (n + 4)$ for all integers $n \geq 0$ (An empty sum $\sum_{i=1}^0$ is defined to be 0. Do not use the result shown in class that $\sum_{i=1}^n i = \frac{n(n+1)}{2}$).

Figure 1: problem 2

2.1 solution

base case: $n = 0$

$$\sum_{i=1}^n 2i + 3 = n(n + 4)$$

$$= \sum_{i=1}^0 2i + 3 = n(n + 4)$$

$$0 = 0$$

(empty set rule used above)

inductive step: suppose $n \geq 0$, and the rule applies to n

$$\begin{aligned} \sum_{i=1}^{n+1} 2i + 3 &= \sum_{i=1}^n 2i + 3 + (2(n + 1) + 3) \\ &= n(n + 4) + (2(n + 1) + 3) \\ &= n^2 + 4n + (2(n + 1) + 3) \\ &= n^2 + 6n + 5 \\ &= (n + 1)(n + 5) \\ &= (n + 1)((n + 1) + 4) \end{aligned}$$

3 problem 3

Problem 3 (10 points): Define a sequence by $a_1 = 8$ and $a_i = a_{i-1} + 4i - 2$ for $i \geq 2$. Prove by induction that for any positive odd integer n , a_n is a multiple of 8. (There are many approaches to this, but there must be a proof by induction in your answer. That may be weak induction with a strengthened induction hypothesis, induction on odd integers, or, if you figure out some closed-form formula for a_n , then you would need to prove that your formula is correct by induction.)

Figure 2: problem 3

3.1 solution

base case: $n = 1$

$$a_1 = 8$$

$$8 \mid 8$$

induction step: suppose for all $n \geq 1$, $odd(n) \rightarrow 8 \mid a_n$

$$\begin{aligned}
a_{n+2} &= [a_n + 4(n+2) - 2] + 4((n+1) + 1) - 2 \\
&= [a_n + 4n + 2] + 4(n+2) - 2 \\
&= a_n + 4n + 2 + 4n + 6 \\
&= a_n + 8n + 8
\end{aligned}$$

since $8 \mid a_n \wedge 8 \mid 8n \wedge 8 \mid 8$ and since $n+2$ is odd $8 \mid a_{n+2}$ given n is an odd natural number

4 problem 4

Problem 4 (10 points): Define a sequence by $a_0 = 4$, $a_1 = 16$, and $a_n = 2 \cdot a_{n-1} + a_{n-2} - 2$ for $n \geq 2$. Prove by strong induction that $a_n \equiv 4 \pmod{6}$ for all integers $n \geq 0$.

Figure 3: problem 4

4.1 solution

base cases:

$$a_0 = 4 \pmod{6}$$

$$a_1 = 16 = 4 \pmod{6}$$

induction step (strong):

for some index i where $\exists i \in \mathbb{N}[0 \leq i \leq n-1]$ and that $p(i)$ is true (that $a_i \equiv 4 \pmod{6}$)

$$a_n = 2 \cdot a_{n-1} + a_{n-2} - 2$$

$$a_n \pmod{6} = 2 \cdot 4 \pmod{6} + 4 \pmod{6} - 2 \pmod{6}$$

$$= 8 \pmod{6} + 4 \pmod{6} - 2$$

$$= 2 \pmod{6} - 2 \pmod{6} + 4 \pmod{6}$$

$$= 4 \pmod{6}$$

$$a_n \equiv 4 \pmod{6} \text{ for all integers } n \geq 0$$
